The Prodigy Potter's Wheel is a fantastic entry level wheel that has been designed with value and durability in mind.

1/3 HP continuous duty motor

12 Inch Twist and Lift Cast Aluminium Wheel Head ('Lotus' upgrade available)

Round 1 Piece Splash Pan (Larger Splash Pan available)

Plastic vacuum formed Table-top for complete water protection

Reverse rotation available.

Handles Like A Sports Car!

If wheels were fabrics...this one would be silk. The smoothness of a wheel is determined by a lot of things; the controller, the motor, the belt, the foot pedal...they all have to work together in a choreographed dance at high speeds, at low speeds, with a lot of clay and with very little.

The Motor

Fitted with a Continuous Duty rated motor. These motors are tested under very rigorous conditions.

The Controller

Controllers have settings that determine the min/max speed, the torque, the rate at which the wheel head speeds up and slows down and something called IR Comp. IR comp on a potter's wheel is designed to send more power to the wheel when it feels that it is being bogged down, like when you are centring a large amount of clay or maybe when a student wants to see how strong they are! When you take your hands off the clay, the additional power to the wheel is brought back to normal because the resistance is gone.

All Prodigy Wheels are shipped with IR Comp turned **off** as our research tells us that most potters prefer to control the needed power with the foot pedal.

Removable Wheel Head

No.... not with a screwdriver and a PHD in Engineering, simply twist and pull up. This innovative design allows you to have full access to your splash pan for cleaning. If you have one of our removable splash pan designs you will definitely appreciate our one piece splash pan. No longer will you need to fuss with cleaning out your splash pan before you can bring it to the sink to clean. Just bring it straight to your clay reclaimer or bin and dump it- it's that easy!

The Shaft

The large diameter shaft on a Skutt wheel ensures durability under the heaviest of clay loads.

The Foot Pedal

The three most important factors are; the smoothness, how it ergonomically fits your foot, and how durable it is.

Check, Check and Check!

It was designed by a potter so it has to be smooth and feel good on the foot. He also knew he wanted to sell these wheels to schools and knew the constant abuse they would be subjected to so he built it stout using metal parts where others used plastic. You are going to **love** this foot pedal.

Optional upgrades (please contact us for details)

Lotus Wheel Head

CH7070

Larger splash pan

SW-4048
